- 1 Certain equipment, instruments, software, or materials, commercial or non-commercial, are identified in this  
2 paper in order to specify the experimental procedure adequately. Such identification does not imply  
3 recommendation or endorsement of any product or service by NIST, nor does it imply that the materials or  
4 equipment identified are necessarily the best available for the purpose.
- 5 There may be references in this publication to other publications currently under development by NIST in  
6 accordance with its assigned statutory responsibilities. The information in this publication, including concepts and  
7 methodologies, may be used by federal agencies even before the completion of such companion publications.  
8 Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist,  
9 remain operative. For planning and transition purposes, federal agencies may wish to closely follow the  
10 development of these new publications by NIST.
- 11 Organizations are encouraged to review all draft publications during public comment periods and provide feedback  
12 to NIST. Many NIST cybersecurity publications, other than the ones noted above, are available at  
13 <https://csrc.nist.gov/publications>.

43    **Abstract**

44    The Cybersecurity Framework Profile for Artificial Intelligence (AI) Profile (“Cyber AI Profile” or  
45    “The Profile”) will provide guidelines for managing cybersecurity risk related to AI systems as  
46    well as identifying opportunities for using AI to enhance cybersecurity capabilities. The Profile is  
47    organized using the NIST Cybersecurity Framework 2.0 outcomes (Functions, Categories, and  
48    Subcategories). This Preliminary Draft is shared along with a request for public comment to  
49    solicit feedback on the planned direction and content. Comments received will inform the initial  
50    public draft. More information about this project, including a roadmap, is available on the  
51    [National Cybersecurity Center of Excellence \(NCCoE\) Cyber AI Profile project page](#).

52    **Keywords**

53    artificial Intelligence; Community Profile; Cyber AI Profile; Cybersecurity Framework; risk  
54    management.

55    **Reports on Computer Systems Technology**

56    The Information Technology Laboratory (ITL) at the National Institute of Standards and  
57    Technology (NIST) promotes the U.S. economy and public welfare by providing technical  
58    leadership for the Nation’s measurement and standards infrastructure. ITL develops tests, test  
59    methods, reference data, proof-of-concept implementations, and technical analyses to advance  
60    the development and productive use of information technology. ITL’s responsibilities include  
61    the development of management, administrative, technical, and physical standards and  
62    guidelines for the cost-effective security and privacy of other than national security-related  
63    information in federal information systems.

64    **Note to Reviewers**

65    The purpose of this Preliminary Draft is to share insights regarding the direction of technical  
66    content in the Cyber AI Profile. NIST welcomes feedback and input on any aspect of this  
67    publication. Specifically, NIST seeks feedback on:

- 68    1.    Document structure and topics:  
69         a)    How do you envision using this publication? What changes would you like to  
70              see to increase/improve that use?  
71         b)    How do you expect this publication to influence your future practices and  
72              processes?  
73         c)    Are the proposed topics in this document sufficient to help your organization  
74              prioritize cybersecurity outcomes for AI?

75        2. Focus Area descriptions (Section 2.1):

- 76            a) How well do the Focus Area descriptions reflect the scope and characteristics  
77            of AI usage? Are any characteristics missing, and if so, what are they and how  
78            should we describe them?

79        3. Profile content (Sections 2.3-2.8):

- 80            a) When thinking about applying the Cyber AI Profile, how useful (or not) is it  
81            for all three Focus Areas to be shown alongside each other (as they are  
82            currently reflected)? What value might there be in providing Profile content  
83            for each Focus Area separately?
- 84            b) What format(s) would be useful for providing the information in the Cyber AI  
85            Profile (e.g., a spreadsheet/workbook, the NIST Cybersecurity and Privacy  
86            Reference Tool (CPRT))?
- 87            c) How well do the priorities and considerations discussed in Sections 2.3-2.8  
88            relate to existing practices and standards leveraged by your organization?  
89            Are there significant gaps between current practices and those that are  
90            necessary to address unique characteristics of AI in each Focus Area that this  
91            publication should address? How should the AI-specific considerations  
92            inform the prioritization of each Subcategory?
- 93            d) NIST published the Cybersecurity Framework (CSF) 2.0 Informative  
94            References and Implementation Examples to show potential ways to achieve  
95            the outcome in each Subcategory. This preliminary draft includes examples  
96            of Informative References for the Cyber AI Profile. Further literature review is  
97            in progress and NIST is seeking more input on Informative References to  
98            include. Which additional AI cybersecurity guidelines, standards, best  
99            practices, or mappings are you using that you recommend adding as  
100            Informative References for the Cyber AI Profile? For any Informative  
101            References you recommend, please share with us why you recommend them  
102            as well as how and why you would prioritize them for this document.

103        4. Glossary (Appendix B):

- 104            a) NIST welcomes requests and suggestions for terms that should be added to  
105            this document's Glossary.

106          Commenters are encouraged to use the comment template provided on [the NCCoE's Cyber AI](#)  
107          [Profile project page](#) for responses to the question set and for specific comments on the text of  
108          the document. You may also submit your feedback and completed comment templates to the  
109          project team at [cyberaiprofile@nist.gov](mailto:cyberaiprofile@nist.gov). The deadline to submit comments is 11:59 p.m.  
110          Eastern Time on January 30, 2026.

111          All comments are subject to release under the Freedom of Information Act.

112 **Call for Patent Claims**

113 This public review includes a call for information on essential patent claims (claims whose use  
114 would be required for compliance with the guidance or requirements in this Information  
115 Technology Laboratory (ITL) draft publication). Such guidance and/or requirements may be  
116 directly stated in this ITL Publication or by reference to another publication. This call also  
117 includes disclosure, where known, of the existence of pending U.S. or foreign patent  
118 applications relating to this ITL draft publication and of any relevant unexpired U.S. or foreign  
119 patents.

120 ITL may require from the patent holder, or a party authorized to make assurances on its behalf,  
121 in written or electronic form, either:

122     a) assurance in the form of a general disclaimer to the effect that such party does not hold  
123         and does not currently intend holding any essential patent claim(s); or

124     b) assurance that a license to such essential patent claim(s) will be made available to  
125         applicants desiring to utilize the license for the purpose of complying with the guidance  
126         or requirements in this ITL draft publication either:

127         i. under reasonable terms and conditions that are demonstrably free of any unfair  
128             discrimination; or

129         ii. without compensation and under reasonable terms and conditions that are  
130             demonstrably free of any unfair discrimination.

131 Such assurance shall indicate that the patent holder (or third party authorized to make  
132 assurances on its behalf) will include in any documents transferring ownership of patents  
133 subject to the assurance, provisions sufficient to ensure that the commitments in the assurance  
134 are binding on the transferee, and that the transferee will similarly include appropriate  
135 provisions in the event of future transfers with the goal of binding each successor-in-interest.

136 The assurance shall also indicate that it is intended to be binding on successors-in-interest  
137 regardless of whether such provisions are included in the relevant transfer documents.

138 Such statements should be addressed to: [cyberaprofile@nist.gov](mailto:cyberaprofile@nist.gov)

174 **Acknowledgments**

175 The authors extend their gratitude to all those who contributed insights that shaped discussions  
176 at the [first Cyber AI Profile Workshop](#) and the three [Community of Interest \(COI\) Working](#)  
177 [Sessions](#). Thank you to the many stakeholders across sectors, and the participants, speakers,  
178 and moderators of the workshop and working sessions, as well as our colleagues at NIST and  
179 The MITRE Corporation who offered the expertise necessary to conduct these events and  
180 review this draft. The thoughtful feedback shared by stakeholders on the initial [concept paper](#)  
181 and through our on-going engagement was instrumental in shaping this Preliminary Draft of the  
182 Cyber AI Profile.

183   **Executive Summary**

184   Recent advancements in Artificial Intelligence (AI) technology introduce new cybersecurity  
185   opportunities and challenges for organizations. Long active in both cybersecurity and AI, NIST  
186   has worked closely with stakeholders in conducting research and advancing standards and  
187   technology. NIST is utilizing its cybersecurity and AI resources to assist organizations in  
188   addressing these new AI opportunities and challenges.

189   Working with the cybersecurity and AI communities, NIST is creating the Cybersecurity  
190   Framework Profile for Artificial Intelligence Profile (“Cyber AI Profile” or “The Profile”) to create  
191   a consistent and common approach for discussing how AI advances inform organizations’  
192   cybersecurity risk management strategies, as well as to provide a resource for organizations to  
193   strategically adopt AI while addressing and prioritizing emerging cybersecurity risks stemming  
194   from advancements in AI. The Cyber AI Profile is not meant to replace existing frameworks, but  
195   provides prioritized cybersecurity guidelines for organizations securing AI, using AI to enhance  
196   cybersecurity defenses, or defending against adversarial uses of AI. The Cyber AI Profile will use  
197   the CSF 2.0 Functions, Categories, and Subcategories to provide informed, structured,  
198   technology-neutral recommendations for cybersecurity and AI professionals.

199   The Cyber AI Profile will address the following three Focus Areas:

- 200   • **Securing AI System Components (Secure):** Focuses on identifying cybersecurity  
201   challenges when integrating AI into organizational ecosystems and infrastructure.
- 202   • **Conducting AI-Enabled Cyber Defense (Defend):** Focuses on identifying opportunities to  
203   use AI to enhance cybersecurity processes and activities, and understanding challenges  
204   when leveraging AI to support defensive operations.
- 205   • **Thwarting AI-Enabled Cyber Attacks (Thwart):** Focuses on building resilience to protect  
206   against new AI-enabled threat vectors.

207   This document is a Preliminary Draft of the Cyber AI Profile. The Preliminary Draft is intended to  
208   convey current thinking regarding the direction of the technical content, identify additional  
209   Informative References that the document should include, and to seek feedback from the  
210   public to inform the Initial Public Draft.

## 211 1. Introduction

212 The National Institute of Standards and Technology (NIST) Cybersecurity Framework (CSF) 2.0  
213 provides voluntary guidance to help organizations manage, reduce, and communicate  
214 cybersecurity risks. The Framework was created through collaboration with a wide range of  
215 stakeholders and encourages a prioritized, risk-based approach to addressing cybersecurity  
216 issues. The NIST Artificial Intelligence Risk Management Framework (AI RMF) broadly addresses  
217 the responsible use of Artificial Intelligence (AI) systems and points to the [NIST CSF](#) and [NIST](#)  
218 [Risk Management Framework \(RMF\)](#) as some of the available tools for managing any associated  
219 cybersecurity risks.

220 Although the Frameworks present a variety of mitigations, Community Profiles apply the CSF to  
221 prioritize cybersecurity outcomes in a specific context. The Cybersecurity Framework Profile for  
222 Artificial Intelligence (AI) Profile (“Cyber AI Profile” or “The Profile”) serves this purpose for AI.  
223 NIST is also in the process of developing a series of [NIST Special Publication \(SP\) 800-53 Control](#)  
224 [Overlays for Securing AI Systems \(COSAiS\)](#) as implementation-focused guidelines to help  
225 organizations customize and prioritize the most critical controls to consider when using AI  
226 systems.

227 To develop this Cyber AI Profile, the NIST engaged stakeholders from government, academia,  
228 and industry to better understand the current state of the cybersecurity challenges facing the  
229 AI and cybersecurity communities. NIST first published the [Cybersecurity and AI Workshop](#)  
230 [Concept Paper](#) in February 2025 to gather stakeholder perspectives on a CSF Community Profile  
231 based on the intersection of cybersecurity and AI. These perspectives were discussed in a public  
232 workshop held by NIST in April 2025. In April 2025, NIST conducted a public workshop focused  
233 on the benefits and challenges associated with leveraging AI in organizational and cybersecurity  
234 operations. This workshop also focused on how organizations can leverage existing NIST  
235 Frameworks, such as the CSF, RMF, AI RMF, and the Privacy Framework to help address the  
236 identified challenges. Participants also explored the scope and practical applications of the  
237 Cyber AI Profile. NIST published [reflections from the April 2025 workshop](#) to document the  
238 concepts identified in the workshop, including the benefits, concerns, and challenges associated  
239 with adopting AI, the current state of relevant cybersecurity risk management practices [1],  
240 gaps in securely implementing and leveraging AI for organizational operations, as well as  
241 thwarting AI-enabled cybersecurity attacks.

242 As a follow-on effort, in August and September of 2025, NIST conducted three public working  
243 sessions designed specifically to identify cybersecurity priorities needed to develop the Cyber AI  
244 Profile. Each working session explored one of the three Focus Areas, with the intention of  
245 learning more from the AI and cybersecurity communities about what support cybersecurity  
246 programs need as they manage the impacts of AI to their organization. Materials from these  
247 working sessions can be found on each event page under the Post Event Materials section  
248 ([Conducting AI-enabled Cyber Defense](#), [Securing AI System Components](#), and [Thwarting AI-](#)  
249 [enabled Cyber Attacks](#)).

250 As a Preliminary Draft, this Profile is still in development.

251 **1.1. Purpose**

252 In discussions with members of the AI and cybersecurity communities, it was strongly suggested  
253 that there would be value in developing guidance based on the CSF to address the  
254 cybersecurity challenges related to AI adoption and use. Organizations may vary on whether  
255 and how they are using AI within their operations—some may not yet be using AI, and some  
256 may only be using cybersecurity solutions enabled with basic machine learning (ML) technology  
257 for pattern detection and planning, and some may be exploring newer and transformational AI  
258 capabilities, such as Generative AI (GenAI).

259 However, regardless of where organizations are on their AI journey, their cybersecurity  
260 programs need risk management approaches that support and integrate the realities of  
261 advancements in AI. The Cyber AI Profile is intended to support cybersecurity programs as they  
262 manage the impacts of advancements in AI to their organization by helping organizations  
263 secure AI system components, such as models, agents, algorithms, prompts, and data; take  
264 advantage of the new opportunities AI offers to improve cybersecurity defenses; and prepare  
265 for changes to the threat landscape based on adversarial use of AI.

266 In doing so, the Profile seeks to help organizations integrate AI-specific considerations into  
267 existing cybersecurity programs by:

- 268     • Establishing a shared understanding of AI-related cybersecurity priorities and  
269         considerations for any organization;
- 270     • Fostering collaboration and communication across the AI and cybersecurity  
271         communities; and
- 272     • Providing common AI cybersecurity target outcomes that organizations can use to  
273         support strategic planning efforts and cybersecurity assessments, based on the CSF  
274         Core.

275 The Cyber AI Profile provides information that organizations can integrate into existing  
276 cybersecurity programs to manage AI opportunities and risk alongside other systems, data and  
277 technologies. Like any new technology, implementing AI can introduce new risks. AI can make  
278 mistakes, offer confident yet incorrect answers, leak sensitive data, and be manipulated by  
279 attackers. And, just like other types of systems, organizations strive for AI systems that are  
280 trustworthy and support organizational objectives for demonstrating responsibility and  
281 accountability. In addition to the feedback on the Concept Paper, the public workshop, and the  
282 three COI working sessions, an on-going and in-depth literature review informed the creation of  
283 this Profile. This Profile builds on and highlights existing work in the cybersecurity and AI fields  
284 useful to organizations as they endeavor to update their cybersecurity risk management  
285 approaches. The Cyber AI Profile also aims to facilitate collaboration and mutual understanding  
286 between the cybersecurity and AI communities to address shared risks and opportunities.

287 **1.2. Scope**

288 The term Artificial Intelligence has a long history with broad connotations and many different  
289 meanings depending on when the term is being used and other contextual factors. Due to the

290 rapidly evolving nature of the field, and an effort to create a publication which is useful and  
291 flexible long into the future, this Profile does not assert a definition of the term “AI” and leaves  
292 application of this Profile open to the broadest sense of the term<sup>1</sup>.

293 The Profile does, however, offer examples of AI throughout to facilitate understanding and use  
294 of this document and uses the term “AI systems” throughout the Profile to refer to any systems  
295 that are using AI capabilities, whether they are stand-alone AI systems or applications,  
296 infrastructure, and organizations that incorporate AI. Examples of types of AI systems in  
297 common use include, but are not limited to:

- 298     • Large Language Models (LLMs) for understanding, interacting with, generating, and  
299         summarizing language-based content.
- 300     • Generative AI systems for content such as text, code, images, video, and audio.
- 301     • Domain-specific optimization systems such as for scheduling or load balancing.
- 302     • Prediction and anomaly detection systems.
- 303     • Expert systems.
- 304     • Data mining, “big data,” and recommendation systems.
- 305     • Search engines.
- 306     • Automated and agentic systems.

307 AI systems may be based on algorithms and techniques that include, but are not limited to:

- 308     • Statistical machine learning (such as regression, clustering, genetic algorithms, decision  
309         trees, and deep learning neural networks).
- 310     • Logic and symbolic reasoning (such as inductive logic programming, human-created  
311         heuristic rules, and fuzzy logic).
- 312     • Heuristic search and planning (such as A\* search).
- 313     • Reinforcement and apprentice learning (such as reinforcement learning with human  
314         feedback (RLHF)).
- 315     • Ensemble, hybrid, and neuro-symbolic techniques.

316 There are many cybersecurity considerations which impact all these systems, algorithms, and  
317 techniques. In many cases, there may be specific types of AI which have unique considerations.  
318 These will be highlighted throughout the Cyber AI Profile.

319 The discussions in this Cyber AI Profile are oriented around three Focus Areas:

- 320     • Securing AI System Components (Secure)

---

<sup>1</sup> NIST’s AI RMF “refers to an AI system as an engineered or machine-based system that can, for a given set of objectives, generate outputs such as predictions, recommendations, or decisions influencing real or virtual environments. AI systems are designed to operate with varying levels of autonomy (Adapted from: OECD Recommendation on AI:2019; ISO/IEC 22989:2022)” The specific types of AI systems are intentionally left broad. There are many types of AI, each with their own set of considerations, mitigations, and response strategies. This document covers broad considerations that encompass most types of AI systems to maintain relevance in the near-term evolution of the field.

- 321     • Conducting AI-Enabled Cyber Defense (Defend)  
322         • Thwarting AI-Enabled Cyber Attacks (Thwart)

323 This Profile organizes discussions about the cybersecurity implications for these three Focus  
324 Areas around the Functions, Categories, and Subcategories of the CSF Core. Considerations  
325 beyond cybersecurity are outside the scope of the Cyber AI Profile.

### 326 **1.3. Audience**

327 The Cyber AI Profile is intended for any organization  
328 that:

- 329     • Is using AI technologies, whether they are stand-alone AI systems (e.g., chatbots and document summarizers) or AI-enabled capabilities that are integrated into other systems (e.g., AI for analyzing and balancing demand across a power grid), regardless of whether the organization builds or purchases AI technologies;
- 337     • Would like to understand and capitalize on the cybersecurity capabilities AI can provide (e.g., AI analytics in cybersecurity tools);
- 340     • Would like to better understand and defend against AI-enabled cyber-attacks (e.g., against adversaries using AI to generate convincing malicious emails); and
- 344     • Is developing AI systems.

345 This Cyber AI Profile can be used by organizations to identify and communicate cybersecurity expectations regarding AI with internal and external stakeholders. The Profile can also be used by organizational leadership to generate priorities tailored to the operational aspects of the organization.

To complement this Cyber AI Profile and support the adoption of the AI Risk Management Framework, NIST is developing a series of [Control Overlays for Securing AI Systems \(COSAiS\)](#) using the [NIST Special Publication \(SP\) 800-53 controls](#). Control overlays enable organizations and communities of interest to tailor the controls (or control baselines) for their specific context and needs. COSAiS will provide additional implementation-focused guidelines and assist users and developers of AI systems manage unique risks in different use cases:

- Adapting & Using Generative AI
- Using & Fine-Tuning Predictive AI
- Using Agentic AI: Single Agent & Multi-Agent

Learn more about the [Control Overlays for AI Project](#), Slack space, and how to join the Slack channel at:

<https://csrc.nist.gov/projects/cosas>

Questions and comments can be directed to [overlays-securig-ai@list.nist.gov](mailto:overlays-securig-ai@list.nist.gov).

### 351 **1.4. Document Structure**

352 The remainder of this document is organized into the following sections:

- 353     • [Section 2](#) discusses Focus Areas and provides the proposed prioritized Subcategories and considerations for each Focus Area, which comprises the Cyber AI Profile.
- 355     • [Section 3](#) contains cited resources.

- 356     • [Appendix A](#) contains a list of symbols, abbreviations, and acronyms used in the Profile.
- 357     • [Appendix B](#) will contain a glossary in future drafts.
- 358     • [Appendix C](#) contains an overview of the NIST CSF.
- 359     • [Appendix D](#) provides ideas for using the Cyber AI Profile

360 **2. The Cyber AI Profile**

361 **NOTE:** This section may expand in the IPD if NIST receives feedback that more information is  
362 needed to explain the Focus Areas.

363 The Cyber AI Profile is organized by the elements of the CSF (Functions, Categories, and  
364 Subcategories) and Focus Areas. The Profile assumes organizations already have a cybersecurity  
365 program in place and provides additional considerations based on an organization's  
366 deployment and use of AI systems. Content in the Cyber AI Profile was developed based on  
367 literature review, inputs from subject matter experts, and working sessions held with  
368 stakeholders and the public.

369 **2.1. Focus Areas**

370 The intersection of cybersecurity and AI has multiple facets. To provide an organizing construct  
371 the Cyber AI Profile offers three Focus Areas that are based on inputs from stakeholders, each  
372 with a single keyword for ease of reference in the detailed Cyber AI Profile discussions. The  
373 Focus Areas are:

- 374 • **Securing AI System Components (Secure):** Focuses on managing cybersecurity  
375 challenges when integrating AI into organizational ecosystems and infrastructure.
- 376 • **Conducting AI-Enabled Cyber Defense (Defend):** Focuses on identifying opportunities to  
377 use AI to enhance cybersecurity processes and activities, and understanding challenges  
378 when leveraging AI to support defensive operations.
- 379 • **Thwarting AI-Enabled Cyber Attacks (Thwart):** Focuses on building resilience to protect  
380 against new AI-enabled threat vectors.

381 While the three Focus Areas each address AI-related cybersecurity risk from a different angle,  
382 they share some commonality, and each Focus Area enables the other two. The paragraphs  
383 that follow provide an overview of these distinctions and relationships, which are summarized  
384 in Fig. 1 below.

385 **Secure** focuses on managing cybersecurity challenges when integrating any type of AI system  
386 into an organization's environment, while considering how an organization's cybersecurity  
387 program may need to adapt to accommodate the unique needs of AI systems. **Defend** focuses  
388 on how organizations can capitalize on the opportunities AI offers to improve their  
389 cybersecurity defensive capabilities, such as taking advantage of new efficiencies. While **Secure**  
390 considers the cybersecurity needs for integrating and managing a broad spectrum of AI  
391 systems, **Defend** considers how AI helps organizations better and more proactively conduct  
392 cybersecurity activities. Both Focus Areas often work hand in hand—when AI systems are well  
393 secured, AI-enabled defenses are better able to find and react to threats targeting those  
394 systems.

395 **Secure** enables an organization's foundational cybersecurity practices, which integrate with  
396 resilience measures to prevent AI-enabled attack addressed by **Thwart**. **Thwart** acknowledges  
397 that AI can play a significant role in helping adversaries become more sophisticated in their

398 attack methods and carry out attacks more efficiently. The knowledge regarding adversarial use  
399 of AI from ***Thwart*** in turn provides insights that help an organization build resiliency into its  
400 overall cybersecurity program under ***Secure***.  
  
401 Together, the cybersecurity considerations for these three Focus Areas Help organizational  
402 cybersecurity programs ***Secure*** their AI systems, take advantage of new AI capabilities to  
403 ***Defend*** their organizations, and proactively ***Thwart*** AI-enabled attacks, and strengthen  
404 cybersecurity defenses based on known threats.

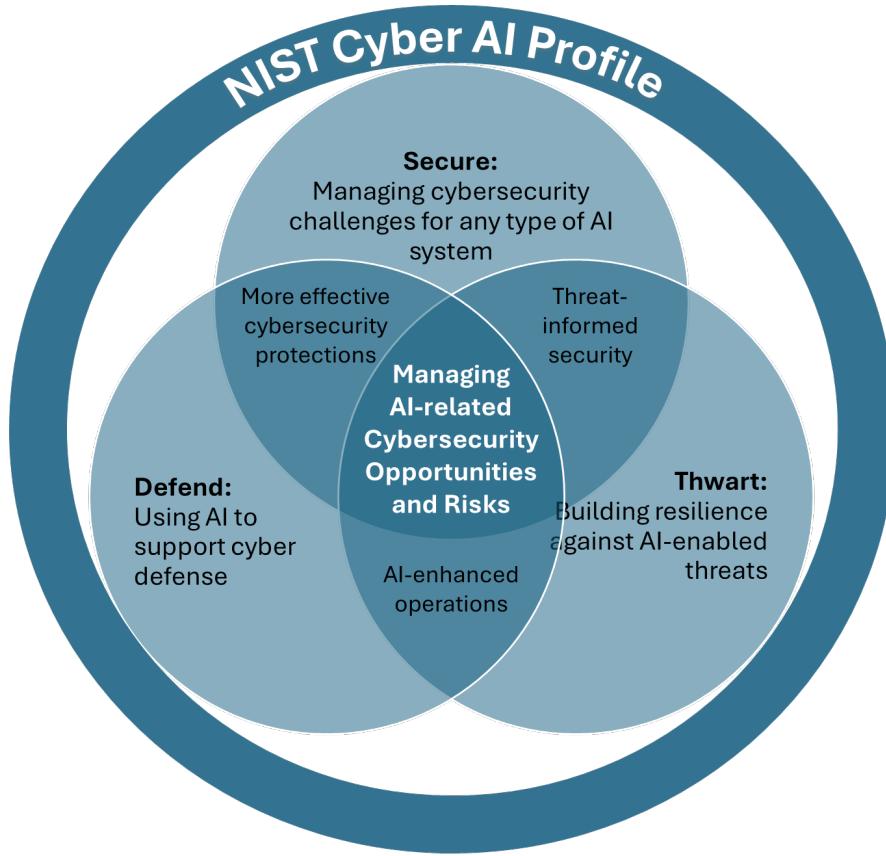

Fig. 11: Relationship Between Cyber AI Profile Focus Areas

405  
406 The scope and characteristics of each Focus Area are described in the subsections that follow.  
407 The Focus Area descriptions informed the decisions made when developing the Cyber AI Profile  
408 content in Sections 2.3-2.8.

409 **2.1.1. Securing AI System Components (Secure)**

410 The Secure Focus Area supplements existing cybersecurity and risk management best practices  
411 to address novel, expanded, and altered attack surfaces associated with the integration of AI  
412 systems into an organization, its ecosystems, and its infrastructure. This covers the AI systems  
413 themselves, their supply chains, including data and machine learning infrastructure, and the  
414 other systems and data that the AI system relies on.

415 AI systems are becoming increasingly important to day-to-day business operations in many  
416 sectors. Examples of uses of AI that fall within the scope of Secure include, but are not limited  
417 to:

- 418
  - Restaurants to forecast demand and take/make orders.
  - Insurance companies to determine risk and premiums.
  - Power grids to balance loads.

421     • Companies and individuals to filter, prioritize, summarize, generate, and proofread  
422        emails, reports, and other documents.

423     • Customer service organizations to perform initial interactions with customers.

424   Each of these sectors and users may have methods for handling cybersecurity challenges but  
425   are still seeking to understand how AI-augmented systems change these cybersecurity risks.  
426   Compared to other types of computer systems, AI behavior and vulnerabilities tend to be more  
427   contextual, dynamic, opaque, and harder to predict, as well as more difficult to identify, verify,  
428   diagnose, and document, when they appear. Once issues are identified, they can also be  
429   difficult to mitigate as some vulnerabilities are inherent to the AI model or the underlying  
430   training data and machine-learning infrastructure.

431   AI presents organizations with opportunities to improve cybersecurity processes while also  
432   introducing new considerations. Each organization will need to determine how to appropriately  
433   assess and manage the impacts of adopting and using AI. Cybersecurity practitioners need to  
434   implement a range of measures related to AI systems, including addressing AI considerations in  
435   employee training, securing the AI systems from adversarial inputs, and maintaining data  
436   quality and integrity.

#### 437 **2.1.2. Conducting AI-Enabled Cyber Defense (Defend)**

438   The scope of the Defend Focus Area is identifying opportunities for the use of AI in supporting  
439   cybersecurity processes and activities and understanding the challenges that come with  
440   leveraging AI to assist in defensive operations. AI is increasingly influential and important to  
441   organizational cybersecurity defense—for example, it can support cybersecurity teams by  
442   sifting through the significant volume of alerts, distinguishing actual threats from noise,  
443   distinguishing the most serious threats, and even prioritizing and providing suggestions about  
444   what actions to take during an active attack. Some teams are also experimenting with agentic  
445   AI, where multiple AI agents coordinate on the identification of attacks and take actions to  
446   defend against them while running checks on each other to improve defenses. Examples of  
447   opportunities to use AI to enhance cyber defense capabilities include:

- 448     • Mission assurance:
- 449        ○ Security governance and policy (e.g., ensuring AI outputs follow organizational  
450            policies)
- 451        ○ Configuration management (e.g., managing configuration drift)
- 452        ○ Supporting automated policy enforcement and compliance assessments to  
453            cybersecurity regulations and standards, including streamlining compliance  
454            tasks<sup>2</sup>

---

<sup>2</sup> Examples include: NIST 800-171, ISO 31000, Defense Federal Acquisition Regulation Supplement (DFARS)/Cybersecurity Maturity Model Certification (CMMC), capability maturity model integration (CMMI)/Federal Risk and Authorization Management Program (FedRAMP).

- 455       ○ Enhance and accelerate information sharing (e.g., use of Structured Threat  
456              Information eXpression (STIX)/Open Cyber Threat Intelligence (OpenCTI) formats  
457              for interoperability and cross-organization sharing)
- 458       ○ Risk communication and executive decision support (e.g., helping CISOs translate  
459              risk to business language)
- 460       ○ Recovery planning (e.g., prioritize which systems to restore and generate  
461              communications during recovery)
- 462     ● Predictive and proactive:
  - 463       ○ Proactive risk management (e.g., predictive analysis of cyber attacks)
  - 464       ○ Identify potential threat actors and tactics that may exploit vulnerabilities (e.g.,  
465              via open-source intelligence (OSINT) datasets for advanced persistent threat  
466              (APT) profiling and integration with ATT&CK®/cyber threat intelligence (CTI)  
467              tools)
  - 468       ○ Predictive maintenance and asset risk forecasting (e.g., tracking asset lifecycle,  
469              predicting end-of-life (EOL) risk, and plan maintenance)
  - 470       ○ Agent-based AI defense (e.g., “swarm” agents, agent sanity check, agentic AI  
471              security reference architectures, continuous validation and authentication with  
472              digital credentials)
- 473     ● Investigation and analysis:
  - 474       ○ Advanced threat detection and analysis (e.g., anomaly detection, outlier  
475              detection, and user and entity behavior analytics (UEBA)) to identify and reduce  
476              false positive (FP) and false negative (FN) rates, identify insider threats, and  
477              prevent fraud)
  - 478       ○ Adapting zero trust modeling to new threat patterns by detecting model drift.  
479              (e.g., source code vulnerabilities detection using AI, using LLM to interpret the  
480              semantic and logic of source code to identify malicious behavior, continuously  
481              monitoring and verifying user behavior and system activity.)
- 482     ● Response and remediation:
  - 483       ○ Adversarial training and simulation (e.g., provide realistic scenarios to train  
484              cybersecurity personnel, real time coaching to improve incident response in real  
485              time, adaptive learning to adjust scenarios)
  - 486       ○ Automated incident response (e.g., AI can help with automated lock down,  
487              incident playbook, and consistency in incident responses)
  - 488       ○ Creating efficiencies for cybersecurity help desks (e.g., handling first-tier  
489              requests, prioritizing reports)
  - 490       ○ Conduct reporting (e.g., writing incident reports and client monitoring outputs)

491 AI can improve defensive processes by augmenting human analysts, enhancing detection and  
492 response time, and supporting recovery. Using AI for cybersecurity defense is a dynamic area  
493 and organizations will need to continuously evaluate whether capabilities are sufficiently  
494 mature for their needs. These opportunities for using AI to bolster cybersecurity defenses are  
495 contemplated in the Profile, as well as new risks that may arise from using AI in these ways.

496 **2.1.3. Thwarting AI-Enabled Cyber Attacks (Thwart)**

497 While AI-enabled attacks are increasingly being reported, many will likely go undetected until  
498 adversary use of AI is better understood, and effective measures are integrated into cyber  
499 defenses. The Thwart Focus Area addresses how AI can enhance adversary capabilities, how  
500 these attacks could impact the entire cybersecurity landscape, and what organizations can do  
501 to bolster their systems against these emerging threats.

502 As cyber attacks evolve and AI becomes increasingly more capable in offensive cyber-related  
503 operations [11, 12, 13, 14], it is necessary to build resilience and robustness into systems to  
504 scale with the growing threat. As with other types of cybersecurity attacks, AI-enabled cyber  
505 attacks could support adversaries across all aspects of the cybersecurity landscape, including  
506 discovering exploitable vulnerabilities or weaknesses, advancing attack paths in shorter  
507 timelines, exfiltrating and tampering with data, and uplifting previously unsophisticated bad  
508 actors [11, 12, 13]. What differentiates these AI-enabled attacks other types of attacks is the:

- 509     • speed and scale with which the attacks occur, making countermeasures harder to  
510       implement within typical timelines;  
511     • ease with which adversaries could deploy AI-enabled attacks; and  
512     • dynamic and optimized nature of AI.

513 These factors will have an impact on the ability to properly and efficiently identify, mitigate,  
514 and establish defenses for this evolving threat landscape [14].

515 Attacks targeting personnel are one of the leading ways AI-enabled cyber-attacks are gaining a  
516 foothold into systems. AI-enabled spear-phishing attacks exploit users through more realistic  
517 communications including audio and video manipulation, such as with DeepFake attacks.  
518 Additionally, new Generative AI (GenAI) techniques can create hyper-realistic malicious  
519 websites and links that can be spread through email phishing. These emerging AI-enabled cyber  
520 attacks take little effort on the adversary to generate, and with the proliferation of personal  
521 data distributed on social media and online, they can create personalized profiles of their  
522 intended targets that follow trust-building narratives. These attacks showcase the need for  
523 updated training for personnel and integrated, automated defenses to bolster current email  
524 and authentication security measures.

525 Another example of AI-enabled attacks comes from adversaries leveraging AI to generate new  
526 forms of malware to obfuscate their intentions or make current signature-based detections and

527 anti-virus systems fail, such as malware that is executed from computer memory rather than  
528 hardware and unlikely or seemingly benign file types to hide planted malware instructions.  
529 A third example of AI-enabled attacks involves the use of AI agents to autonomously  
530 orchestrate different phases of a cyber attack, from reconnaissance and attack surface mapping  
531 to vulnerability exploitation to credential harvesting, lateral movement, and data collection. AI  
532 agents are increasingly capable of autonomously operating common cybersecurity tools and  
533 utilities, such as network scanners, password crackers, exploitation frameworks, and binary  
534 analysis suites [14].  
535 The Thwart Focus Area builds on capabilities under Secure and Defend to draw out additional  
536 proactive measures to get out in front of adversarial uses of AI.

537 **2.2. How to Read the Cyber AI Profile**

538 Tables 1-6 use the CSF Core to summarize AI-related considerations, where relevant, for each of  
539 the 106 CSF Subcategories<sup>3</sup>. Each table addresses a single CSF Function. Each table contains the  
540 following columns:

- 541 • **CSF Core:** provides the CSF Core elements (Functions, Categories, and Subcategories) and  
542 their descriptions.
- 543 • **General Considerations:** contain non-exhaustive AI-related considerations for achieving the  
544 outcomes in each Subcategory (where relevant) that apply across more than one Focus  
545 Area and that can inform an organization's prioritization of a Subcategory.
- 546 • **Focus Area Proposed Priorities & Considerations:** includes a sub-column for each of the  
547 three Focus Areas, which includes:
  - 548 ○ **A Proposed Priority** (described below) for indicating how important it may be for  
549 organization to achieve the Subcategory's outcome(s) to meet the objective of  
550 each Focus Area.
  - 551 ○ **Sample Opportunities** are included only for the Defend Focus Area to present  
552 opportunities to leverage AI to help achieve the outcomes in the Subcategory.  
553 Sample Opportunities are not provided for every Subcategory since not every  
554 Subcategory will have an AI opportunity.
  - 555 ○ Non-exhaustive AI-related **Sample Focus Area Considerations** to help  
556 organizations effectively achieve the outcomes in the Subcategory (where  
557 relevant to the objective of the Focus Area). The considerations supplement  
558 existing cybersecurity practices with the intent to integrate AI considerations  
559 into existing programs. Considerations are based on observations in the field  
560 and/or subject matter expertise.  
561 The phrase “standard cybersecurity practices apply” is used to indicate that  
562 there are no unique considerations identified for the Focus Area and the

---

<sup>3</sup> Considerations only appear where there are unique AI-related concepts for implementing the Subcategory.

563           activities of the cybersecurity program are sufficient for AI systems. These  
564           considerations also include the rationale for Subcategories that are designated  
565           as a High (1) or Moderate (2) proposed priority. For Defend, these considerations  
566           are only related to the opportunities listed.

567           ○ **Example Informative References** includes a broad range of widely available and  
568           broadly applicable resources (laws, standards, guidelines and other research  
569           publications). These supplementary materials informed the Subcategory  
570           considerations and proposed priorities. They may also be useful for organizations  
571           as they consider how to achieve the outcomes in the Subcategory. Organizations  
572           can also use the Example Informative References to understand where they may  
573           already be achieving those outcomes. (**NOTE:** The NIST SP 800-53 controls in the  
574           General Considerations column are listed exactly as they appear in the crosswalk  
575           available through the NIST National [Online Informative Reference \(OLIR\)](#)  
576           Catalog<sup>4</sup>).<sup>5</sup>

577       Determining the considerations and priority of each Subcategory is a subjective exercise that is  
578       based on observations in the field and/or subject matter expertise. The Cyber AI Profile offers  
579       these proposed priorities to help organizations determine which Subcategories they may wish  
580       to address sooner. The priorities are not intended to reflect the degree of difficulty in achieving  
581       the Subcategory. The priority level of Subcategories may be higher or lower for individual  
582       organizations based on characteristics of the environment, needs, risk tolerance, or other  
583       factors. The proposed level of Subcategory priorities is indicated in each Table by number:

- 584       ● **“1” for High Priority:** These Subcategories are considered the most critical to address  
585       the challenges for a Focus Area. High priority Subcategories should typically be  
586       addressed most immediately given available resources.
- 587       ● **“2” for Moderate Priority:** These Subcategories should be the next priority after  
588       implementing High Priority Subcategories.
- 589       ● **“3” for Foundational Priority:** These Subcategories are generally important to the Focus  
590       Area but may not require the same level of urgency as higher priorities. Note that  
591       “Foundational” does not equate to low priority. All Subcategories should receive  
592       consideration.

593       Although organizations should develop strategies that address all Subcategories as part of a  
594       cybersecurity program, the prioritizations offered in the Cyber AI Profile provide adaptable  
595       guidance that suggests cybersecurity capabilities that will provide the greatest impact toward  
596       meeting the AI-related challenges associated with each Focus Area. As in any risk management  
597       discussion the decision to deploy AI-related cybersecurity mitigations should be evaluated in

---

<sup>4</sup> The mapping between CSF 2.0 and NIST SP 800-53, Rev 5, as available at: <https://csrc.nist.gov/projects/olir/informative-reference-catalog/details?referenceId=131#/> (last accessed 12/5/2025).

<sup>5</sup> Per the AI Action Plan, the AI RMF is currently in revision and will be included in a future version.

598 the context of the organization's needs and risk tolerances. Trade-offs may vary for a given  
599 mitigation in different environments.

CSF 2.0 Core: GOVERN	General Considerations	Focus Area Proposed Priorities & Considerations		
		Secure	Defend	Thwart
GOVERN (GV)	The organization's cybersecurity risk management strategy, expectations, and policy are established, communicated, and monitored			
Organizational Context (GV.OC)	The circumstances—mission, stakeholder expectations, dependencies, and legal, regulatory, and contractual requirements—surrounding the organization's cybersecurity risk management decisions are understood			
GV.OC-01: The organizational mission is understood and informs cybersecurity risk management	General Considerations: No general considerations identified - see Focus Area Considerations.  Example Informative References: NIST SP 800-53, Rev 5: PM-11	Proposed Priority: 3  Focus Area Considerations: Standard cybersecurity practices apply.  Example Informative References: OWASP General Governance; OWASP Supply Chain	Proposed Priority: 3  Focus Area Considerations: AI defense should support the organizational mission by accelerating detection and filtering noise, but humans should stay in the loop when Generative AI (GAI) tools are being used due to AI hallucination.  Example Informative References: ENISA Threat Landscape 62; DASF v4 Model Management; DASF v4 LLM hallucinations; MITRE ATLAS mitigations AML.M0020, AML.M0021; OWASP AI Exchange, p. 7, section "Summary - How to address AI Security?" <a href="https://arxiv.org/pdf/2311.05232.pdf">https://arxiv.org/pdf/2311.05232.pdf</a>	Proposed Priority: 3  Focus Area Considerations: Standard cybersecurity practices apply. <b>Cybersecurity Supply Chain Risk Management (GV.SC)</b>	Cyber supply chain risk management processes are identified, established, managed, monitored, and improved by organizational stakeholders			
GV.SC-01: A cybersecurity supply chain risk management program, strategy, objectives, policies, and processes are established and agreed to by organizational stakeholders	<p><b>General Considerations:</b> Organizations need to understand the origins of AI components (e.g., microservices, containers, libraries, data, hardware software), the new vulnerabilities they may introduce, and their potential impacts to cybersecurity.</p> <p><b>Example Informative References:</b> NIST SP 800-53, Rev 5: PM-30; SR-02; SR-03; <a href="#">Reflections from the First Cyber AI Profile Workshop</a></p>	<p><b>Proposed Priority: 2</b></p> <p><b>Sample Focus Area Considerations:</b> With AI, data provenance should be weighted just as heavily as software and hardware origin.</p> <p>All data input (both training and inference input) is an aspect of the supply chain for AI. With RL, data comes from the environment it is trained in. Take special care that the environmental conditions of the model are aligned with supply chain risk.</p> <p><b>Example Informative References:</b> DASF 22, 23, 32, 45, 51, 53; ATLAS AML.M0023; OWASP AI Exchange: General Governance Controls;</p>	<p><b>Proposed Priority: 2</b></p> <p><b>Sample Focus Area Considerations:</b> The integrity of training and input data (part of the data supply chain) should be verified to detect and prevent data poisoning and tempering.</p> <p>In some organizations, RL can be used to detect malicious activity on a network. For example, a model that uses online learning is constantly improving from day-to-day activity. A malicious actor could work out how to trigger the alarm system in the model, while keeping the network intact and operating normally. Overtime, the model may “learn” that this behavior is creating false alarms and cease to alert operators when</p>	<p><b>Proposed Priority: 2</b></p> <p><b>Sample Focus Area Considerations:</b> Standard cybersecurity practices apply. (Rationale) Suppliers and third parties with access to internal data, systems, and software may be the target of AI-enabled cyber attacks.</p> <p><b>Example Informative References:</b> NIST SP 800-161 Rev. 1; AI 100-2e2025</p>

Improvement (ID.IM)	Improvements to organizational cybersecurity risk management processes, procedures and activities are identified across all CSF Functions			

CSF 2.0 Core: IDENTIFY	General Considerations	Focus Area Proposed Priorities & Considerations		
		Secure	Defend	Thwart
ID.IM-01: Improvements are identified from evaluations	<p><b>General Considerations:</b> AI introduces a suite of new metrics to consider. Carefully select which metrics closely align with the organization's goals. For instance, perhaps FPs are much more important than false negatives, in which case evaluation metrics will be more heavily influenced by precision rather than recall, and using metrics such as an F1 score may obfuscate results.</p> <p>Incorporate feedback loops to continue improving AI use in cybersecurity activities.</p> <p><b>Example</b></p> <p><b>Informative References:</b> NIST SP 800-53, Rev 5: AC-01; AT-01; AU-01; CA-01; CM-01; CP-01; IA-01; IR-01; MA-01; MP-01; PE-01; PL-01; PM-01; PS-01; PT-01; RA-01; SA-01; SC-01; SI-01; SR-01; CA-02; CA-05; CA-07; CA-08; CP-02; IR-04; IR-08; PL-02; RA-03; RA-05; RA-07; SA-08; SA-11; SA-17(06); SI-02; SI-04; SR-05</p>	<p><b>Proposed Priority:</b> 2</p> <p><b>Sample Focus Area Considerations:</b> Evaluations in ML need to be carefully weighed and considered. Consider the structure and form of the evaluation datasets, as well as what biases may exist in that data. Also consider identifying appropriate metrics to measure a model's performance. Oftentimes, accuracy does not fully reflect adequacy of performance.</p> <p><b>Example Informative References:</b> OWASP AI Exchange: Controls to Limit the Effects of Unwanted Behavior; OWASP Conventional Runtime Controls; OWASP AI Exchange: General Governance Controls; OWASP AI Exchange: Model Access Control; OWASP Model Input Controls; OWASP GenAI Security Project: Monitor; OWASP LLM Top Ten: LLM03 Supply Chain; ENISA Threat Landscape 2025; AI 100-2e2025; <a href="https://arxiv.org/html/2503.11917v3">https://arxiv.org/html/2503.11917v3</a></p>	<p><b>Proposed Priority:</b> 3</p> <p><b>Sample Opportunities:</b> AI supports reporting by drafting clear incident summaries and compliance reports, organizing evidence, and producing standardized documentation to reduce workload of analysts.</p> <p><b>Sample Focus Area Considerations:</b> Identify continuous security improvements by evaluating AI model performance metrics (e.g., precision/recall, drift rates) against security goals, such as FP reduction and adversarial robustness.</p> <p><b>Example Informative References:</b> DASF 38,39,50; OWASP AI Exchange: Model Access Control; ATLAS AML.M0008; ENISA Threat Landscape 2025; AI 100-2e2025; <a href="https://arxiv.org/html/2503.11917v3">https://arxiv.org/html/2503.11917v3</a></p>	<p><b>Proposed Priority:</b> 2</p> <p><b>Sample Focus Area Considerations:</b> Standard cybersecurity practices apply. (Rationale) Organizations may consider leveraging and implementing AI-assisted defenses to maintain pace and scale of AI-enabled cyber attacks. See the opportunities and considerations of the Defend Focus Area for guidance.</p> <p><b>Example</b></p> <p><b>Informative References:</b> <a href="https://ieeexplore.ieee.org/document/10747338">https://ieeexplore.ieee.org/document/10747338</a>; AI 100-2e2025; <a href="https://arxiv.org/html/2503.11917v3">https://arxiv.org/html/2503.11917v3</a></p>

876 This appendix will include terms defined and explained to facilitate a reader's comprehension  
877 of the report.

## 878 Appendix C. Cybersecurity Framework 2.0 Overview

879 This Community Profile is based on the NIST Cybersecurity Framework (CSF) 2.0, which provides  
880 a flexible and risk-based approach to managing cybersecurity. The CSF helps organizations of  
881 any size, sector, or level of cyber maturity address their unique cybersecurity risks while  
882 improving communication and collaboration across stakeholders.

883 The CSF Core is a taxonomy of high-level cybersecurity outcomes that can help organizations  
884 manage their cybersecurity risks. The Core components are a hierarchy of Functions,  
885 Categories, and Subcategories that detail each outcome. These outcomes can be understood by  
886 a broad audience, including executives, managers, and practitioners, regardless of their  
887 cybersecurity expertise.

888 The CSF Core Functions (Govern, Identify, Protect, Detect, Respond, Recover) organize  
889 cybersecurity outcomes at their highest level. The Core then identifies underlying Categories  
890 and Subcategories for each Function. The six Functions of the CSF 2.0 Core are composed of 22  
891 Categories, which are further broken down into 106 Subcategories of more specific outcomes.  
892 The Core structure is depicted in Fig. 3 below.

893

Fig. 3: CSF Core Structure

894 Sections 2.3-2.8 contain the descriptions of the CSF Functions, Categories, and Subcategories  
895 that are relevant to the Cyber AI Profile. Additionally, the NIST [CSF website](#) provides  
896 supplemental resources to help organizations understand, adopt, and use the CSF and achieve  
897 the desired outcome of each Subcategory, including [Implementation Examples and Informative](#)  
898 [References](#). Communities and organizations can choose to add their own Implementation  
899 Examples and Informative References that are unique to their environment in the future.

## 900 **Appendix D. How to Use the Cyber AI Profile**

901 The Cyber AI Profile is designed to support an organization's cybersecurity program with  
902 understanding cybersecurity-related opportunities for implementing AI capabilities and  
903 managing new cybersecurity risks introduced by AI systems, regardless of where they are on  
904 their AI journey. Use of the Cyber AI Profile will:

- 905 • Provide organizations with proposed priorities for achieving the outcomes described in  
906 of the CSF Core;
- 907 • Assist organizations in understanding how AI advances can enhance approaches to  
908 cybersecurity risk management;
- 909 • Assist organizations in understanding where AI advances may introduce new  
910 cybersecurity risks; and
- 911 • Provide a common approach for discussing the nexus of cybersecurity and AI.

912 The Cyber AI Profile provides guidance that can be adapted based on an organization's maturity  
913 level, available resources, needs, and goals. For example, an organization may want to  
914 prioritize, remove, or add Focus Areas. An organization may also adjust the proposed priorities  
915 of the Subcategories, or choose a different prioritization schema.

916 The Cyber AI Profile provides an informed starting point for organizations to identify and  
917 address desired cybersecurity outcomes for AI. An organization can use the information in the  
918 Cyber AI Profile to support risk management activities, such as:

- 919 • Benchmarking internal progress against community priorities and considerations (e.g.,  
920 when creating or updating a Current Profile);
- 921 • Informing Target Profile(s);
- 922 • Communicating the significance of impacts when analyzing the gaps between Current  
923 and Target Profiles;
- 924 • Facilitating decision making when allocating budget, personnel, and other resources;
- 925 • Determining which cybersecurity outcomes are most important to assess and validate  
926 as part of the organization's cybersecurity risk management program;
- 927 • Developing implementation and action plans; and
- 928 • Communicating expectations with vendors, partners, and other external stakeholders.

929 While the Cyber AI Profile provides insights to help organizations make decisions, it is up to  
930 each organization to determine its priorities and how to achieve the outcomes in the CSF Core.  
931 For example, organizations may choose to address one Focus Area at a time, instead of all three

- 932 at once. Organizations may also make decisions like addressing only the High Priority (1)
- 933 Subcategories first, before addressing the others.
